Introducing K-Zone[®] Technology (KZT[®]) a breakthrough design that provides the support of a kinesiology taping treatment without the inconvenience of its temporary and binding nature. Using a hypoallergenic gel stabilizer system with high resistance fabrication zones, KZT[®] creates a strapping type effect in specific areas to steady and help secure supportive joint structures. The result is stabilization without immobilization. Proper medical-grade compression in combination with KZT[®] provides a slip-on therapy solution for use whenever you need it. KZT[®] is found in the newest OrthoSleeve[®] product the AF7[®] Ankle Bracing Sleeve.

The KZ[®] Ankle Stabilizer Zone acts as a woven "stay" developed using high resistance fabrication techniques. This eliminates the use of a plastic or metal bar for stabilizing the ankle and, instead, creates flexible rigidity for support. This Ankle Stabilizer Zone fuses into the Lateral Gel Stabilizer Bar for a seamless bracing effect similar to various clinical taping techniques.

The KZ[®] Lateral Gel Stabilizer Bar is a one-of-a-kind bracing element designed to stabilize the Talus and midtarsal joints without immobilizing. This provides lateral stabilization for inversion resistance to neutralize unsafe motion. By combining KZT[®] with Compression Zone Technology[®] optimal positioning is achieved, for multiple type ankle injury prevention.

DS6[™] KZT[®]

Heel-Lock firmly locks in the heel for stabilization and to support decompression for pain relief.

Resistance Bands with low stretch construction are woven into fabric like strips of tape.

Forefoot Gel-Lock comfortably adheres to the medial and lateral forefoot to assist decompressing the arch.

Item# F-DS6 - Replicates Low Dye Taping Before & After Tech Sheet

Pam Haig, C.Ped, educator and founder of The Robert M. Palmer, M.D., Institute Of Biomechanics, is the co-inventor of the DS6™ Decompression Sleeve and explains the comparison with clinical taping after years of podiatric clinical trials:

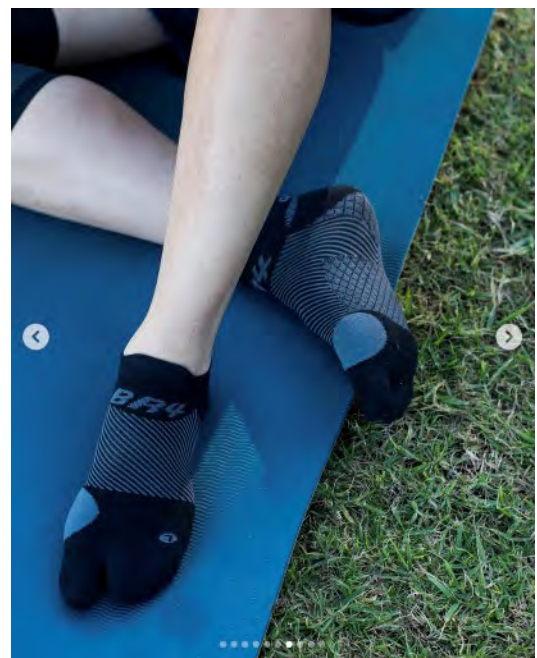

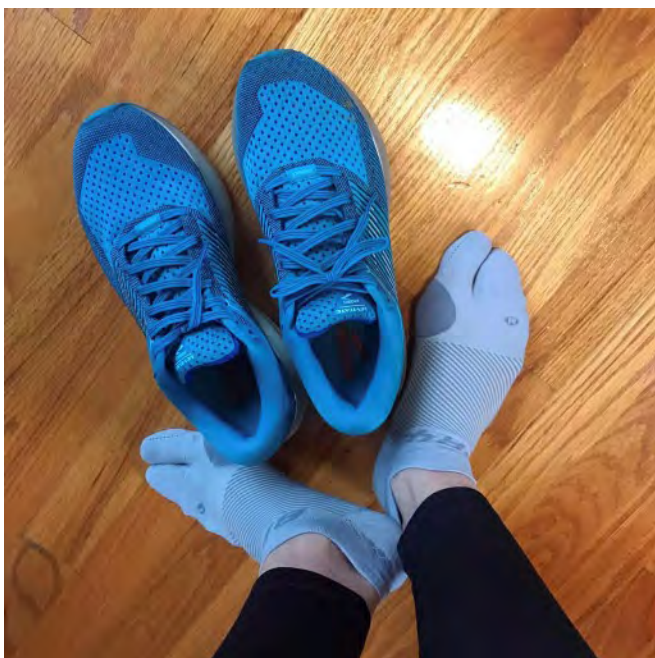

"K-Zone® Technology is consistent with 'Low Dye' taping theories to raise the arch, improve arch integrity to maintain a better alignment position. The DS6 sleeve reduces the treatment time required and improves patient compliance. This new technology stabilizes the foot from the metatarsal heads to the posterior heel and Achilles tendon, thereby reducing the amount of structural and soft tissue collapse of the arch which results in foot elongation, strain, overuse and pain from Plantar Fasciitis and a variety of biomechanical symptoms."

Proof of Concept

1. Surrounding tissue is formed and supported for stability.
2. Fascia is clearly pulled up and stretched.
3. Achilles is compressed and shaped into the ankle area for extra support.
4. Compression increases the tissue/fat pads under the heel by 20%.

Authentication: The attached images were captured on X-Ray film at DeMaine Chiropractic & Rehab Centers, 500 Poinsett Highway, Greenville, South Carolina. As the supervising physician and technician producing the X-ray images, I hereby certify the validity and integrity of these images captured in a controlled environment. These images are unaltered and in their original state from point of capture to computer screen. TESTIMONIALS

"I just want to let you know that I've received the FS6 product, and have used it for about a week now. It is truly AMAZING! I am running a 50K this weekend, and the FS6 will be on my feet. It is truly amazing how much better my feet feel both day and night, and even when on a run."
